Traction & Metrics Report

Verified platform state, operational telemetry and the honest position on commercial traction.

We separate two things that are frequently conflated in pre-seed materials: platform traction, which is real and verifiable, and commercial traction, which is not yet established. Both are stated here.

1. Platform traction — shipped and running

- Multi-tenant production platform with strict organization-level isolation enforced at the database layer.
- Fifteen-plus operational modules live: execution, attendance, HR, finance, documents, communication, meetings, workflows, KPIs, support, notifications and administration.
- Graph-native intelligence substrate: entities, edges and events materialized on Postgres and queryable through the intelligence layer.
- Enterprise cognition layer: AI executive deliberation, organizational memory with human approval and audit trail, and predictive alerting on scheduled jobs.
- Trust surface: signature ledger, compliance exports, inter-organization consent and audit logging, status page and security pack.
- Investor infrastructure: secure data room with access logging, due-diligence tracker and verified live metrics.

2. Verified operational metrics

The investor portal exposes a live metrics panel read directly from the running production system rather than from a static slide. Organizations, active users, tasks executed, meetings hosted, documents managed and intelligence queries served are reported from the database at the time of viewing. Investors are invited to verify these figures in session.

3. Commercial position — stated plainly

Item	Status
Revenue	Pre-revenue
Paying customers	None to date
Design partners	Program open; recruitment funded by this round
Retention / NRR	Not yet measurable
Team	Founder-led, three-person leadership; Africa engineering center

4. What the next twelve months must prove

- That organizations adopt the operational wedge and keep it in weekly use.
- That intelligence consumption expands revenue beyond the seat baseline.

- That CAC payback lands inside the modelled 6–9 month range on a real cohort.
- That the organizational memory measurably improves recommendation acceptance over time.

No forward-looking figure in this document should be treated as achieved. Every metric marked as a target is an assumption this round exists to test.
