Product Screenshots & Demo Flows

A guided walkthrough of the live platform and the flows we demonstrate in diligence sessions.

Global Office is a production system, not a prototype. This document describes what an investor will see in a live session and the order in which we show it. Every flow below can be executed against the running platform on request.

Flow 1 — Organization health dashboard

Entry point for leadership. A weighted health score computed in real time from execution throughput, attendance signal and KPI attainment, with departmental breakdown and trend. Demonstrates that the score is derived from live operational data rather than manual entry.

Flow 2 — Execution engine

Kanban delivery across projects with AI priority scoring, workload balancing across people, and blocked-work detection. We show a task moving through the lifecycle and the corresponding graph and alert updates.

Flow 3 — Knowledge graph explorer

Every person, task, document, message and decision as a queryable entity with typed edges. This is the substrate that separates an intelligence layer from a suite of modules.

Flow 4 — Executive cognition

A question posed to the AI executive council, the deliberation trace across executives and consultants, the recommendation with its evidence, and the human approve or reject decision recorded in organizational memory with a mandatory reason.

Flow 5 — Meetings intelligence

Live video with transcription, immediate post-meeting summarization, extracted action points written back into the execution engine, and downloadable minutes.

Flow 6 — Workflow automation

Visual IF/THEN automation composed by an operator without engineering involvement, triggered by real events across leave, expenses, documents and tasks.

Flow 7 — Predictive alerts

Scheduled analysis surfacing slipping work, burnout risk and overdue concentration before a deadline is missed, delivered as suggestive alerts with an audit trail.

Flow 8 — Trust, compliance and administration

Signature ledger, compliance export, inter-organization sharing consent, access token audit, status page, and the super-admin tenant view.

Screenshots of each flow are embedded in the investor deck and rendered live on the investor page. We prefer a live walkthrough to static images and will run one on request.
